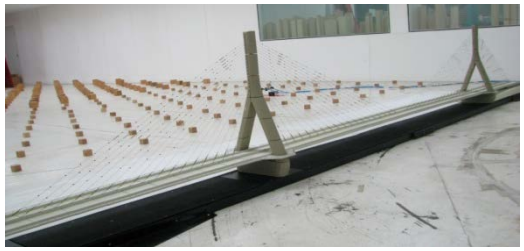
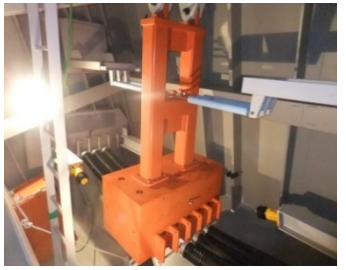
TE Solution
Total Engineering Solution
in Wind Engineering and Vibration Control

Introduction of TESolution





Contents

CEO's Message

CEO Yun-seok KIM

Our company was established in February 2001, with the goal to provide better life to our clients through our accurate evaluation of safety and serviceability of various structures and our solutions to improve them, based on our differentiated technical expertise and accumulated experience in the field of Wind Engineering and Vibration Control.

As to the field of Wind Engineering, TESolution provides solutions for safer and better life with evaluation on serviceability of buildings and bridges, through wind resistance stability tests, wind induced vibration tests, and evaluation on wind environment based on our highest level of expertise and technically advanced facilities.

As to the field of Vibration Control, TESolution provides solutions to improve the quality of living environment through our vibration control devices that reduce or suppress the vibration occurred from wind load, seismic load, or traffic load on various structures.

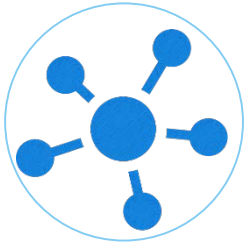
We promise our very best to provide satisfactory results for our clients with our differentiated technical services and our continuous R&D efforts.

CEO of TESolution
Dr. Kim, Yun Seok

Vision

Top

Strive to be leaders in the field of Wind Engineering & Vibration Control through the higher levels of product quality and customer service



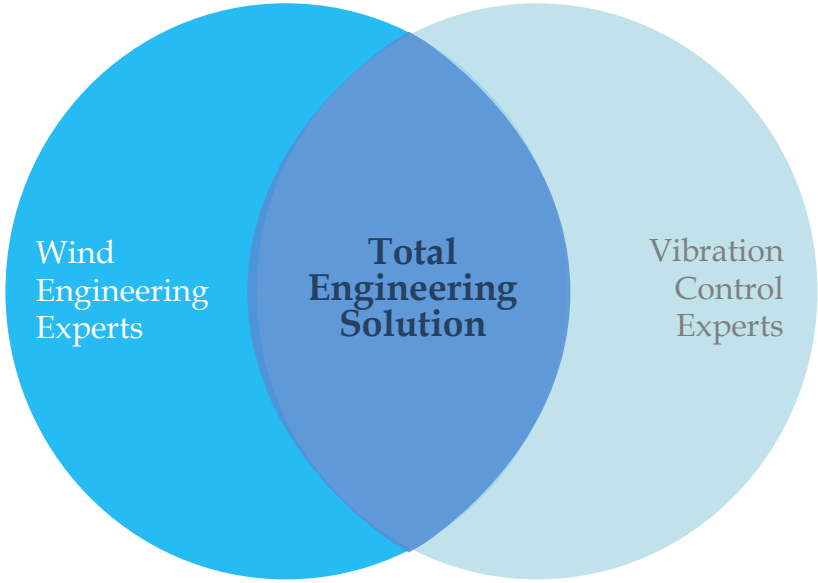
Harmony

Promote greater harmony with people & nature by providing the best solution to our customers

Differentiate

Differentiate with continuous R&D and comprehensive solution

People



"We strive to provide Total Engineering Solution in Wind Engineering & Vibration Control."

History

2001 Foundation of TESolution

2003 Installation of the first TMD for bridge in Korea (2nd Jindo Bridge)

2004 Installation of the first TMD for residential building in Korea (Centum City, Busan)

2005 Moved HQ to Anseong with new office building and wind tunnel facilities

2007 Installation of the first AMD in Korea (Lotte-Hotel Ulsan)

2010 Installation of the biggest TMD in Korea (160t. Posco E&C HQ)

2011 Completion of Test Tower Development

2012 Marked 150 Wind Tunnel Tests for Bridges

2012 Built Korea's first HMD at Tecno Mart

2014 Marked 200 Wind Tunnel Test for Buildings

2014 Certified with ISO9001:2008, ISO140001, OHSAS18001:2007

2015 Dubai Ferris Wheel TMD Project

Taipei Treasure Garden Res. Building Project

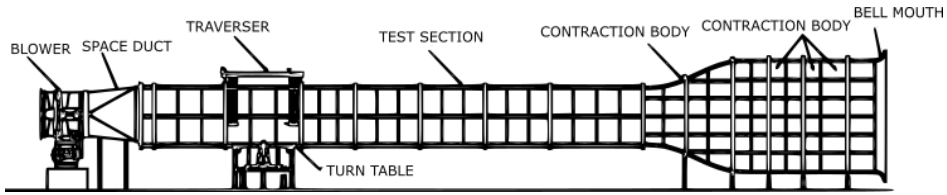
2016 New York Ferris Wheel TMD Project

R&D of Stockbridge Damper

Facility & Equipment

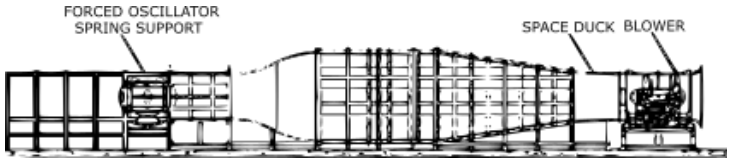
Boundary Layer Wind Tunnel | Wind Tunnel for Section Model | Test Tower | Structural Laboratory

Type	Open-circuit (Suction)
Test Section	8.0m(w) x 2.5m(h) x 23.2m(l)
Wind Speed	0.3 ~ 11.0m/s
Turbulence Intensity	0.5% , Wind Speed Deviation ±1.0%
Suction Fan	3EA, 132kW



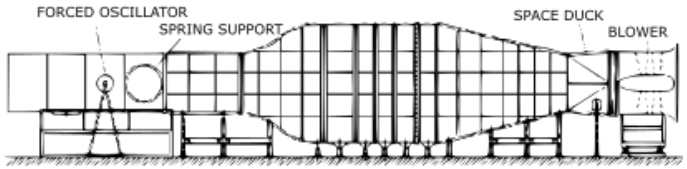
Facility & Equipment

Mid-size 2D Wind Tunnel



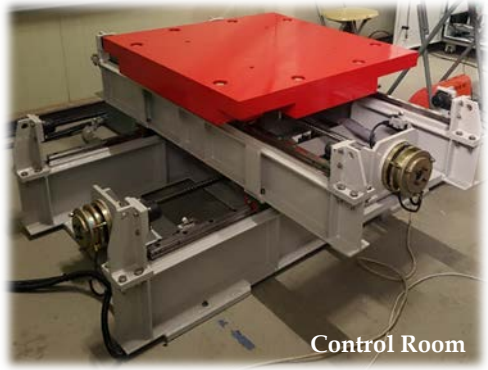
Type	Test Section Dimension	Wind Speed
Eiffel-type	1.5 m (W) x 2.0 m (H) x 7.5 m (L)	0.3m/s ~ 25.0 m/s

Small-size 2D Wind Tunnel

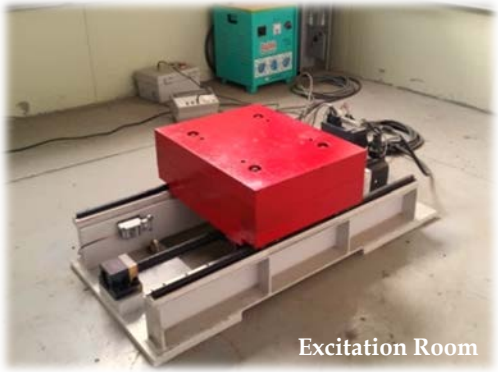


Type	Test Section Dimension	Wind Speed
Eiffel-type	1 m(W) x 1.5 m (H) x 6 m (L)	0.3m/s ~ 21.0m/s

Facility & Equipment



Control Room

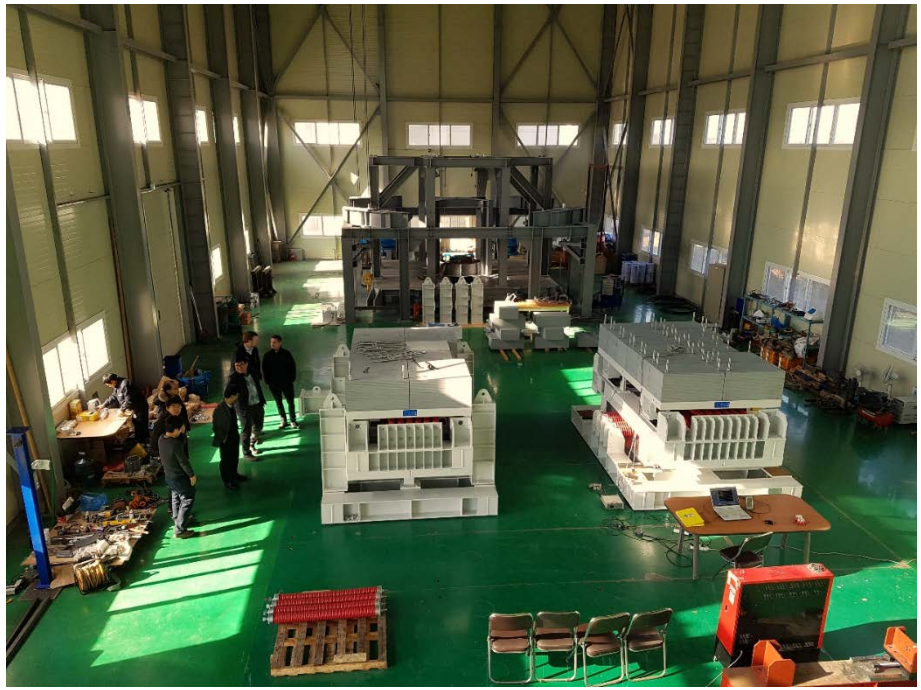


Excitation Room

Composition	Control Room
	Excitation Room
Heights	5 Stories (20m Height)
Description	Performance testing for developed vibration control devices

Facility & Equipment

1st Structural Laboratory



2nd Structural Laboratory

Lead Engineers

Description

Dr. Yun-seok Kim has worked as the chief of wind engineering & vibration control department in Hyundai Institute of Construction Technology for over 10 years. As the pioneer of vibration control system in Korea, he installed the first Hybrid Mass Damper in Korea on the control tower of Incheon International Airport. He has also conducted many wind engineering studies of high-rise buildings and long span bridges during his tenure. He established TESolution Co., Ltd. in 2001, and has led the operation of over 300 wind tunnel tests and vibration control system projects. He is also contributing to the academia of wind engineer as the Vice President of Wind Engineering Institute of Korea.

Dr. Yun-seok, KIM

CEO
TESolution

Education

- Ph.D. in Civil Engineering. Korea Advance Institute of Science & Technology (KAIST), 1992
- M.Sc. in Civil Engineering. Kyoto University Graduate School (Japan), 1988

Experience

- 2002~Present: CEO of TESolution
- 1997~Present: Vice President of Wind Engineering Institute of Korea
- 1993~2002: Principal Research Engineer of Hyundai Engineering & Construction
- Adjunct Professor of KAIST, Sungkyunkwan University, Kyonggi University

Lead Engineers

Dr. Seok-jun, JOO

Managing Director
TESolution

Description

Dr. Seok-joon Joo is a specialist in the field of wind-induced vibration control system and wind tunnel test. He obtained his Doctor's degree in 2000, with study on Robust Control of High-rise Building. As one the leading Researchers at Wind Engineering & Vibration Control Department at Hyundai Institute, he played a vital role in development of the first Hybrid Mass Damper in Korea. He is one of the foundering members of TESolution, and has conducted over 30 vibration control projects and 100 wind tunnel tests. He has played a major role in obtaining number of patents such as Vibration Control Device of Construction Structure and Vibration Control and Elasto-plastic Vibration Control Device.

Education

- Ph.D in Architectural Engineering, Seoul National University, 2000
- M.Sc. in Architectural Engineering, Seoul National University, 1995
- BA in Architectural Engineering, Seoul National University, 1991

Experience

- 2002~Present: Director of TESolution
- 2010~2011: Visiting Scholar of University of Western Ontario (Canada)
- 2000~2002: Senior Research Engineer of Hyundai Engineering & Construction
- 1998~1999: Instructor of Seoul National University of Science & Technology

Lead Engineers

Dr. Seung-woo LEE

Director
TESolution

Description

Dr. S.W. Lee received his M.S. in civil engineering from KAIST in 1998. He has studied vibration isolation of bridge. After obtaining a master's degree, he worked as a researcher of wind engineering & vibration control department at Hyundai Institute of Construction Technology. In 2004, he joined TESolution and started a course of Ph.D degree at KAIST. He obtained a Ph.D with study of wind engineering and energy harvesting in 2013. During his tenure at TESolution, he has conducted over 150 wind tunnel tests and relevant analyses for wind resistant design of bridges. He has also carried out large numbers of R&D projects regarding bridge and vibration. He is a specialist in the fields of bridge aerodynamics and vibration control.

Education

- Ph.D in Civil Engineering (Korea Advanced Institute of Science and Technology), 2013
- M.Sc. in Civil Engineering. Korea Advance Institute of Science & Technology (KAIST), 1998
- BA in Civil Engineering. Korea Advance Institute of Science & Technology (KAIST), 1996

Experience

- 2004 ~ Present: Director of TESolution
- 2013 ~ Present: Director of Wind Engineering Institute of Korea
- 2014 ~ 2015: Visiting Researcher of University of Arizona (US)
- 2000 ~ 2004: Research Engineer of Hyundai Engineering & Construction

Lead Engineers

Dr. Saang-bum KIM **Director** TESolution

Description

Dr. Saang-bum Kim has worked in the area of bridge and wind engineering. Since he received his Ph.D., he has researched on the vibration control and system identification for large infra structures. From 2005 to 2015, he was a principal research engineer at Samsung C&T with the main research projects: fluid-structure interaction analysis for bridge aero-dynamics, aero-elastic analysis for Mersey gateway bridge, performance evaluation of cable dampers (Incheon/Wando bridge), bridge-train interaction analysis for maglev system, and experimental modal analysis with wireless sensor network. Now he is actively working on the development of vibration control system.

Education

- Ph.D. in Civil Engineering, Korea Advance Institute of Science & Technology (KAIST), 2000
- M.Sc.. in Civil Engineering, Korea Advance Institute of Science & Technology (KAIST), 1993
- BA in Civil Engineering, Korea University, Korea, 1991

Experience

- 2016 ~ Present : Director of TESolution
- 2005 ~ 2016 : Principal Research Engineer of Samsung C&T
- 2005 ~ 2005 : Research Associate of KAIST
- 2003 ~ 2004 : Visiting Scholar of University of Illinois Urbana-Champaign (USA)
- 2001 ~ 2003: Visiting Scholar of Notre Dame (USA)

Lead Engineers

Kyu-Seok Hwang

Director
TESolution

Description

K.S. Hwang received his M.S. in architectural engineering from JBNU(JeonBuk National University), Korea in 1997, where He studied wind engineering of building. He completed his Ph. D. course with study of the wind-induced response of tall buildings from JBNU, Korea in 2013. From 1997 to 2014, he has worked as a Principal Research Engineer of wind engineering & vibration control department at Hyundai Engineering & Construction. He has conducted over 150 wind tunnel test projects of buildings. He is a specialist in the field of wind tunnel test of buildings..

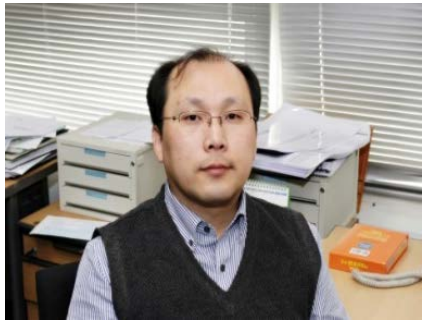
Education

- Ph.D Candidate in Architectural Engineering, JeonBuk National University, Korea, 2013
- M.Sc. in Architectural Engineering, JeonBuk National University, Korea, 1997
- BS. in Architectural Engineering, JeonBuk National University, Korea, 1995

Experience

- 2020 ~ Present : Managing Director of TESolution
- 2015 ~ 2020 : Chief Engineer at R&D Center of WINHITECH
- 1997 ~ 2014 : Deputy General Manager of TESolution
- 2004 ~ 2007 : Principal Research Engineer of Hyundai Engineering & Construction

Lead Engineers



Dr. Suk, HEO

Director
TESolution

Description

Dr. Seok Heo graduated in Dongguk University with Ph. D under prof. M. K. Kwak. After graduation, he worked in University of Nevada, Reno as Post-doc (2003-2005), Konkuk University as Research Professor (2005-2009), and research center of Judico co. as director (2012-2013). He is a specialist in active vibration control of smart structures. He joined TESolution in 2015, and currently in vibration analysis and vibration control of the structures.

Education

- Ph.D. in Mechanical Engineering, Dongguk University, 2003
- M.Eng. in Mechanical Engineering, Dongguk University, 2000
- B.Eng. in Mechanical Engineering, Dongguk University, 1998

Experience

- 2015 ~ Present: General Manager of TESolution
- 2012 ~ 2013 Director of Judico Co. Research Center
- 2005 ~ 2009: Research engineer & instructor in Kumoh National Institute of Technology, Korea
- 2003 ~ 2005: Post-doc., University of Nevada

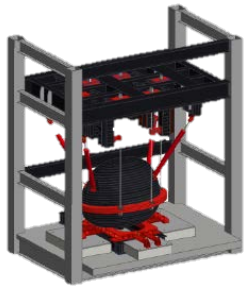
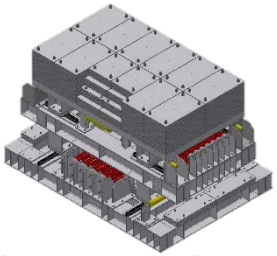
Vibration
Control Devices

- Vibration Measurement: Measurement of structural frequency, damping ratio, and estimation of mode shape.
- Basic/Detail design : Determination of dimension, types, and specifications of tuned mass dampers, drawing works
- Fabrication/ Performance test at TESolution : Friction/vibration tests
- Installation/ Performance test at construction site : Frequency tuning and verification of required control performance
- Maintenance : Check control performance and main components

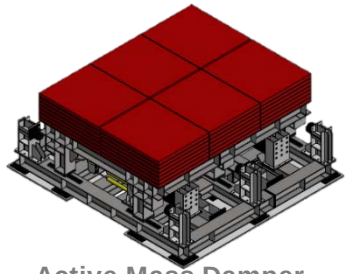
Principle of Vibration Control



Pendulum-type Tuned Mass Damper



Sliding-type Tuned Mass Damper



Active Mass Damper

Vibration
Control Devices

Application for Buildings

International organization for standard-ization (ISO) and building codes in many countries (such as AIJ2004, ISO 10134) recommend that structures meet specific criteria of vibration control classified by natural period of the building and human perception level of building acceleration. The objective of vibration control device is to improve damping efficiency and habitability of building by reducing the building acceleration with the installation of vibration control device.

Songdo POSCO E&C Hezadquarter, Incheon, Korea, 2010

- Tower A – 80T Sliding type TMD
- Tower B - 160 ton Sliding type TMD

TechnoMart, Seoul, Korea, 2013

- 50 ton Hybrid Mass Damper
  40 ton TMD for vertical vibration control
  50 ton AMD for horizontal vibration control

Taichung Treasure Garden, Tachung, Taiwan, 2016

- 150 ton Pendulum type Tuned Mass Damper

Vibration
Control Devices

Application for Bridges

Long-span bridges, such as suspension or cable-stayed bridges are structurally highly vulnerable to wind load due to small bending / momentum stiffness and damping ratio. In case of footbridge, vibration serviceability may not be satisfied due to excessive vertical vibration through pedestrian movement even if the structural safety is satisfied.

Vibration control devices for bridges are installed not only to increase the wind resistant performance under construct-ion and in- service stages but also to improve serviceability of footbridges

Geoga Bridge (Korea)

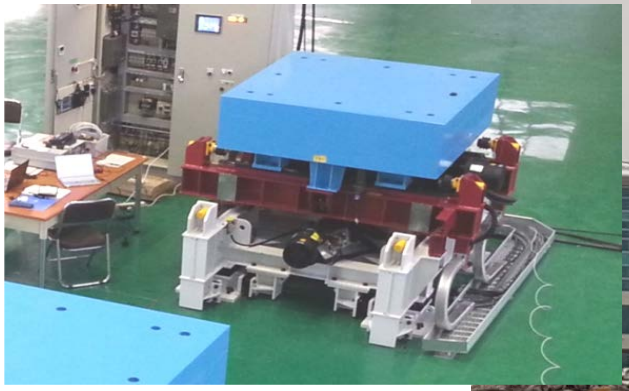
2nd Jindo Bridge (Korea)

Vibration
Control Devices

Application for Special Structures

Vibration control devices can be designed in various shapes and sizes to fit in the tightest installation location to increase structural damping.

Namsan Cable Car (Korea)



Incheon Internation Airport ATC Tower (Korea)

Vibration
Control Devices

Stockbrdige Damper for Bridge Cables

Stockbridge damper, currently most commonly used vibration damper for power line, can be designed to dissipate the input wind energy over a wide range of frequencies

- Aeolian vibration (vortex-induced vibration)
- Galloping
- Wake galloping
- Rain- Wind induced vibration
- Parametric excitation
- Buffeting

Stockbridge Damper, Ulsan Bridge(suspension bridge), 2015

Stockbridge Damper, Palyung Bridge(suspension bridge), 2016

Stockbridge Damper, Palyung Bridge(` bridge), 2016

Structure
Aerodynamics

High Frequency Force Balance Test (HFFB Test)

Major findings:

- Base sheer, base moment
- Static floor-by-floor wind load for structural design
- Wind-induced acceleration, serviceability evaluation (AIJ, ISO6897, ISO10137, NBCC, etc.)

Al Reem Island Four Vanes (UAE)

Busan IFC (Korea)

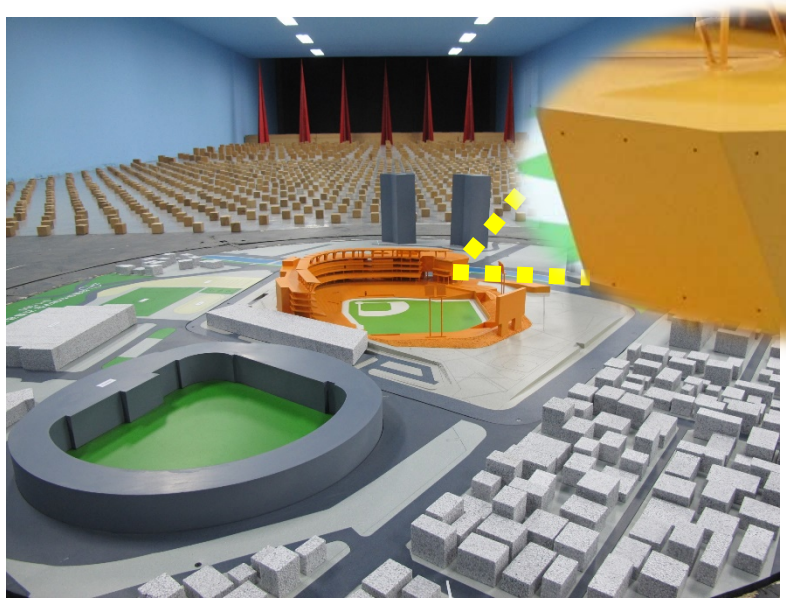
Soho Navi, Al Reem Island (UAE)

Structure
Aerodynamics

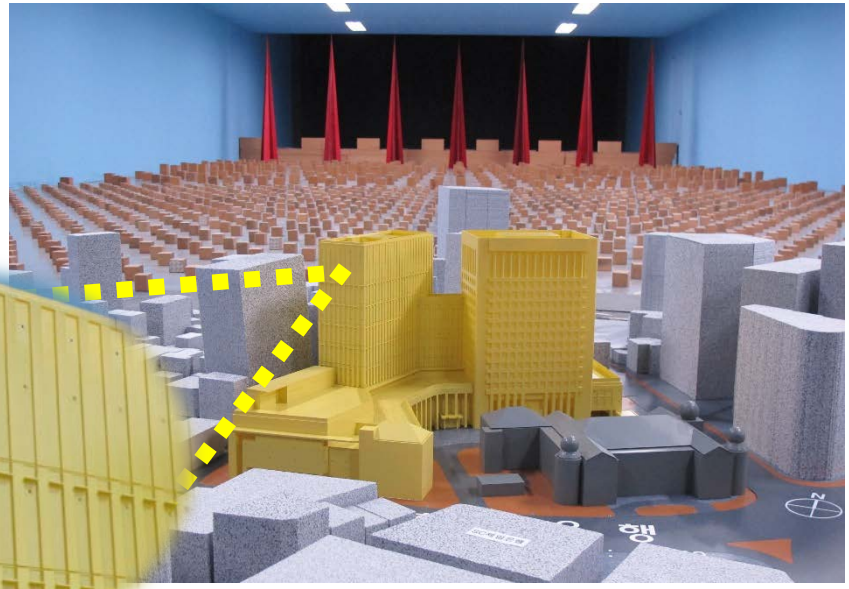
Wind Pressure Test

Major findings:

- Pressure for cladding design
- Wind load for design of roof structures
- Wind pressure for design of structural member for open-air structures such as parapet, canopy, free-standing wall, etc.



Changwon Masan Baseball Stadium (Korea)



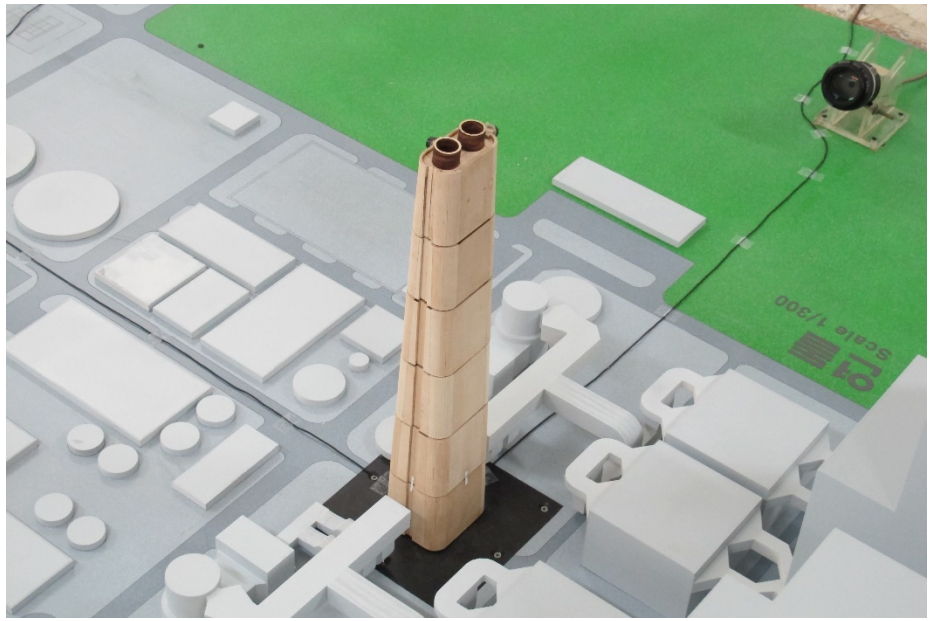
Headquarter of Bank of Korea (Korea)

Structure
Aerodynamics

Aeroelastic Model Test

Major findings:

- Time dependent data of displacement, acceleration response
- Possibility of vortex-induced vibration or aerodynamic instability vibration
- The same findings to that of HFFB Test



Boryoung Power Plant Steel Stack (Korea)

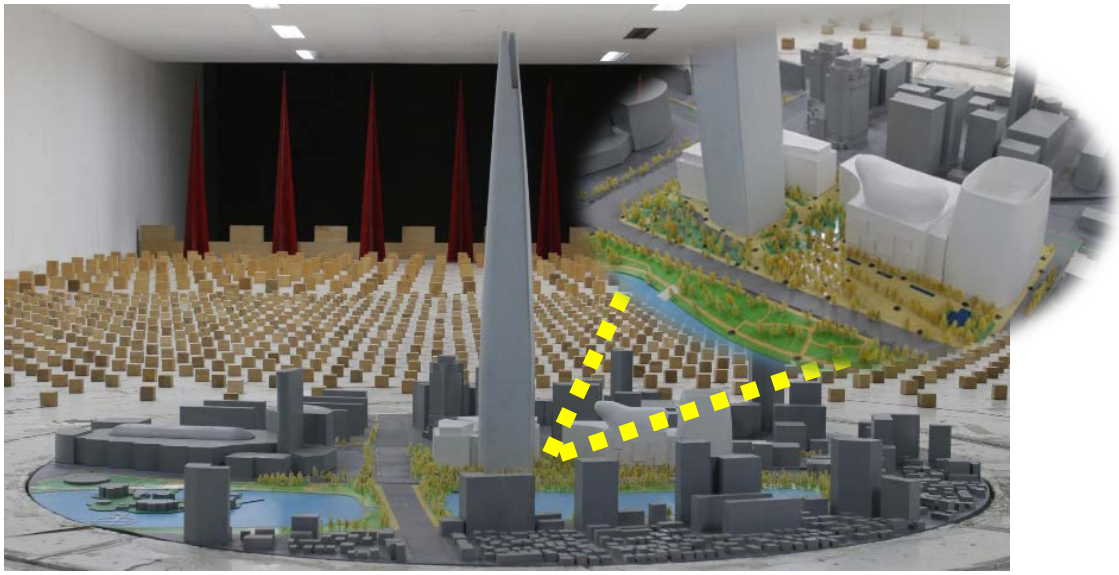
Dangjin Steel Stack (Korea)

Structure
Aerodynamics

Pedestrian-level Wind Environment Test

Major findings:

- Wind spend + wind direction occurrence frequency in relation to the climate data
- Wind speed ratio with respect to design wind speed
- Assessment of pedestrian level wind load
- Visualization of wind flow



Boryoung Power Plant Steel Stack (Korea)

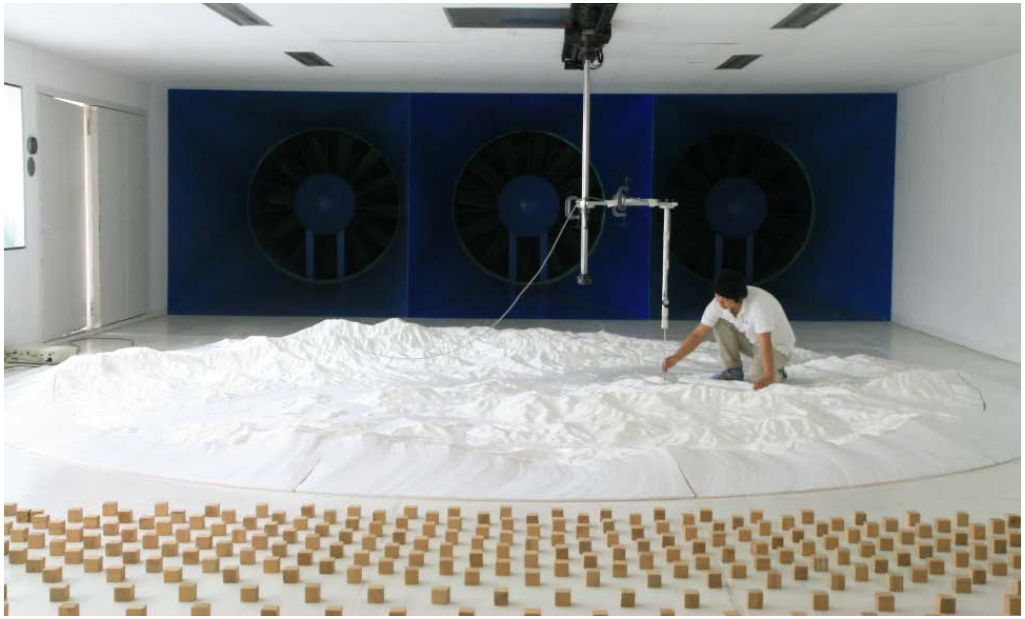
Shangri La Hotel (Mongolia)

Structure
Aerodynamics

Topography Model Test

Major findings:

- Distribution of wind speed (horizontal and vertical directions)
- Distribution of turbulence intensity (horizontal and vertical directions)
- Topographic effects



Everland Resort (Korea)

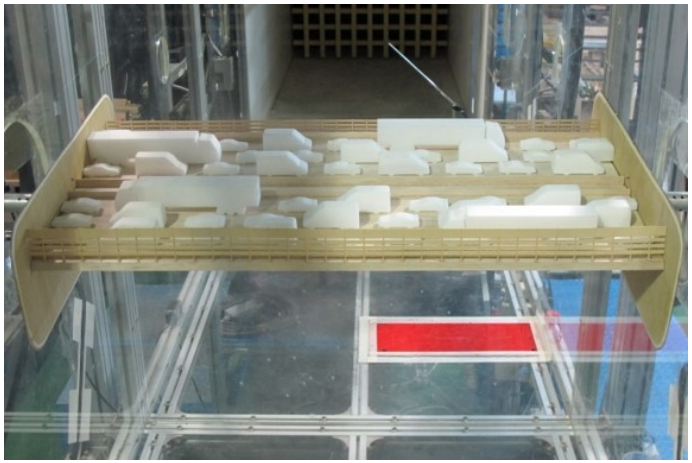
Dokco Island (Korea)

Bridge Aerodynamics

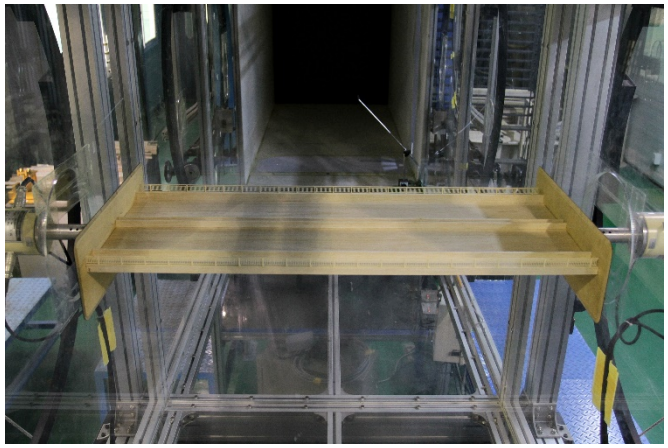
Section Model Tests

Test areas:

- Aerodynamic stability: vortex-induced vibration, flutter, galloping
- Aerodynamic force drag, lift. moment coefficients
- Steady aerodynamic force: drag, lift, moment coefficients.
- Aerodynamic optimization of the shape for unstable aerodynamic behavior of bridge.

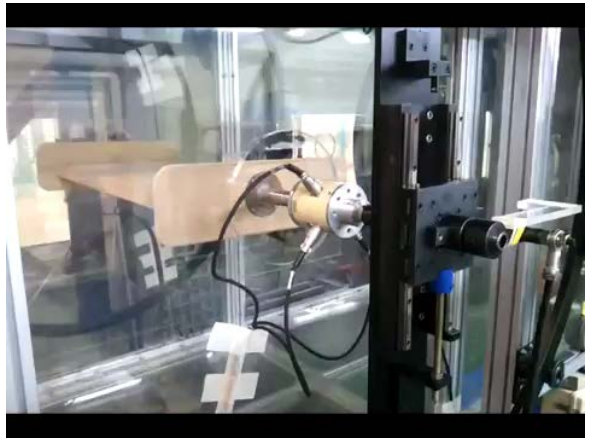


Mersey Gateway Bridge (UK)



New Nile Bridge (Uganda)

Spring Support System



Forced Oscillator

Bridge Aerodynamics

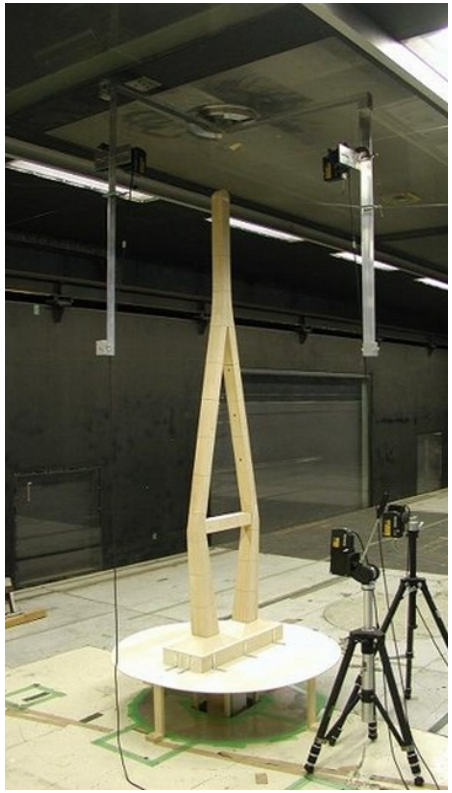
Pylon Model Test

Test areas:

- Aerodynamic stability: vortex-induced vibration, flutter, galloping
- Base shear force, base overturning moment, base torsional moment
- Wind force of pylon legs: Drag, lift, pitching moment coefficients
- Wind force of whole pylon: Drag, lift, torsional moment, overturning moment coefficients
- Aerodynamic optimization of the shape of pylon leg to increase aerodynamic stability and to decrease static deformation due to wind

Vam Cong Birdge (Vietnam)

Chacao Channel Bridge (Chile)



Incheon Bridge (Korea)

Bridge
Aerodynamics

Full Bridge Model Test

Test areas:

- Aerodynamic stability: vortex-induced vibration, flutter, galloping
- Aerodynamic stability of full-bridge in the erection / completed stage should be considered
- Aerodynamic stability of full bridge in various wind directions should be considered

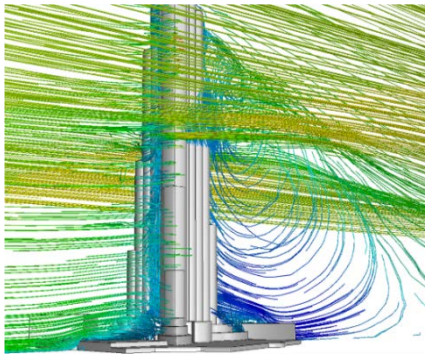
(Effects from topography, construction facilities are considered)

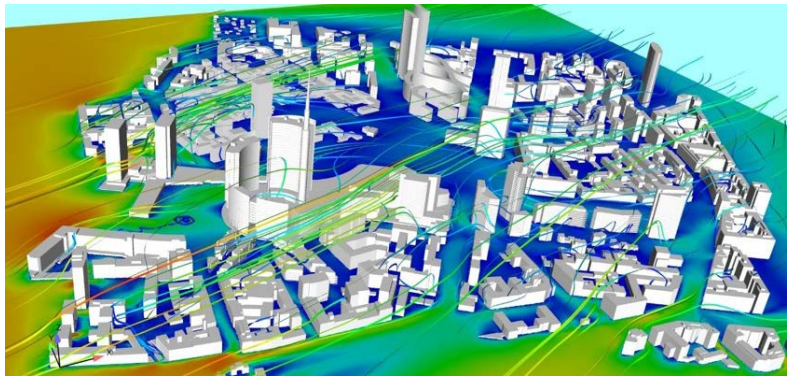
Vam Cong Birdge (Vietnam)

Analytics of Wind & Vibration

Computational Wind Engineering

Computational Wind Engineering [CWE] uses Computational Fluid Dynamics [CFD) method to solve problems encountered in wind engineering. Numerical modeling with CFD can be a powerful alternative as it can avoid limitations of on-site measurements and wind tunnel tests.





Force Vibration Test on Structures

When evaluating dynamic safety of the structure such as wind resistance safety or anti-seismic safety, forced vibration test on structure with shake table can be conducted to effectively gather necessary data

Analytics of Wind & Vibration

Wireless Smart Sensors

Recent advancement in the sensor technologies have enabled Structural Health Monitoring(SHM) using wireless smart sensor networks (WSSNs), which is a promising alternative to the traditional wired SHM approaches. The smart sensors are typically small, inexpensive, and capable of wireless communication and onboard computation, addressing many of the concerns regarding wired monitoring.
